

# *Into Math*

**“HMH”** (Houghton Mifflin Harcourt)

**Presenter:  
Mr. Martin**

**November 10, 2022**

# Math Funnies ...or are they???

When you have insomnia but not a calculator

# MATH

Mental Abuse To Humans

Math is exercise for  
your brain.

Everytime I see a math word problem it looks like this:  
If I have 10 ice cubes and you have 11 apples.  
How many pancakes will fit on the roof?

Answer:  
Purple because aliens  
don't wear hats.

# Current Needs In Math....Here is where you help!

- Our “Foundational 4” - Add, Subtract, Multiply, Divide facts
- Real-world math scenarios (carpentry, store, dinner, etc...). The possibilities are endless to show your kids math at work in the real world!!!
- Homework is ESSENTIAL! - Math is a skill and requires constant practice. Most teachers will give 10-15min of hw max! If it is taking longer, please ask your child if they are doing everything **THEY** need to do in class.
- Challenge each other!
- Don't beat up Math or any subject for that matter!
  - Your perception becomes their perception!

# Into Math Series - Adopted to Start 2022-23 School Year

## Process:

- Why did we need a new math series?
  - Cohesiveness
  - Common Language
  - Bridge the gap between school and home
  - Scores Fell across the district...and state
- Math committee formed to evaluate current needs and review several text books
  - A book aligned to state and local standards
  - Clear and common vocabulary
  - **Lesson and practice that is consistent from grade level to grade level (1-6)**
  - Technology integration!

## Disadvantages:

1. The language is challenging and the application problems require effort and perseverance!
  - a. “Academic Rigor”
  - b. Grades??

## Advantages:

1. Cohesiveness across grade level
2. A physical book to work out of
3. Aligned to state and national standards
4. Integrates technology (Google)
  - a. “Waggle”
5. Increased “Academic Rigor”

# Meet Your Grade Level Specific Textbooks

3rd

4th

6th

# Typical Lesson Layout

1.) Lesson introductions and connection to previous learning

\*I can statement (*expectation*)

2.) Guided questions and scaffolding of the new content w/ examples

3.) Independent practice

4.) Spiral Review

The image shows a page from a math textbook. The page is titled "Compare Fractions Using Visual Models" and is part of "Lesson 1". It includes a "Build Understanding" section with a "I Can" statement: "use visual models to compare two fractions with different numerators and denominators." The main problem is about Liz and Alvin's go-karts. Liz's go-kart has a fuel tank that is  $\frac{3}{5}$  full, and Alvin's go-kart has a fuel tank that is  $\frac{1}{3}$  full. The page shows two go-karts, Liz's red one and Alvin's blue one. Below the go-karts are two identical rectangles representing the fuel tanks. The first rectangle is divided into 5 equal horizontal sections, with 3 sections shaded pink. The second rectangle is divided into 3 equal horizontal sections, with 1 section shaded pink. A "Possible answer" box shows these two rectangles with their respective fractions written below them:  $\frac{3}{5}$  for Liz and  $\frac{1}{3}$  for Alvin. A text box explains that the rectangles are the same size, and the rectangle for  $\frac{3}{5}$  has more shading than the rectangle for  $\frac{1}{3}$ , so Liz's go-kart has more fuel. The page also includes a "Turn and Talk" section with a question: "Why is it important that the size of the fuel tanks in the go-karts is the same? See possible answer at the right." The page number is 267.

**LESSON 1** Build Understanding

**1** Spark Your Learning

**MOTIVATE**  
Introduce the problem by talking about student experiences with go-karts. **Ask Students:** What ways have you seen a gas gauge show how much gas is left in the gas tank? Tell students to discuss in a small group.

**SUPPORT SENSE-MAKING Three Reads**  
Have students read the problem three times. Use the questions in the Three Reads box below for a different focus each time.

**PERSEVERE**  
If students need support, guide them by asking:

- Q Assessing** What fractions do you need to compare to solve this problem?  $\frac{3}{5}$  and  $\frac{1}{3}$
- Q Advancing • Use Tools** Which tool could you use to solve this problem? Why is this tool more strategic? Students' choices of strategies and tools will vary.
- Q Advancing** How can you use visual models to compare the fractions  $\frac{3}{5}$  and  $\frac{1}{3}$ ? Possible answer: I can make two visual models that show the same-sized whole and see which has the greatest portion shaded.

**Turn and Talk** Make sure students realize that the size of wholes must be the same, but the

## 2 Learn Together

### Build Understanding

**Task 1** **MP Use Tools** Suggest that students use fraction strips to represent the lengths of the tracks. Make sure students understand that the length of a track is the distance it takes to go from one position back to the same position one time.

#### Sample Guided Discussion:

- Q What fractions do you need to compare to solve this problem?  $\frac{4}{5}$  and  $\frac{7}{8}$
- A Which fraction model is longer,  $\frac{4}{5}$  or  $\frac{7}{8}$ ?
- A Which fraction model would be longer,  $\frac{5}{5}$  or  $\frac{10}{8}$ ? neither because both are the same length

**Turn and Talk** Encourage students to share their answers. For students who are struggling, encourage them to think about how close each fraction is to 1 mile. Possible answer:  $\frac{4}{5}$  is  $\frac{1}{5}$  from the whole and  $\frac{7}{8}$  is  $\frac{1}{8}$  from the whole.  $\frac{1}{5}$  is greater than  $\frac{1}{8}$  because fifths are larger than eighths. Because I remove a longer piece from the whole to make  $\frac{4}{5}$  than I do to make  $\frac{7}{8}$ ,  $\frac{4}{5}$  is the lesser value.

### Build Understanding

1 There are two go-kart tracks. Which is the shorter track?

Use a fraction model to represent the length of each track. Then draw visual models for your representations.

Track A:  $\frac{1}{4}$  mile Track B:  $\frac{1}{4}$  mile

Possible representation is shown.

- A. How does your fraction model represent  $\frac{4}{5}$  mile? Possible answer: It has four  $\frac{1}{5}$ -fraction pieces placed end to end.
- B. How does your fraction model represent  $\frac{7}{8}$  mile? Possible answer: It has seven  $\frac{1}{8}$ -fraction pieces placed end to end.
- C. How can you use your fraction models to compare the lengths of the tracks? Possible answer: Line up the fraction models for  $\frac{4}{5}$  and  $\frac{7}{8}$  on the left side and look at the right side to see which fraction model is shorter. That shorter model represents the shorter track.
- D. Which track is shorter? Track A

**Turn and Talk** The fractions  $\frac{4}{5}$  and  $\frac{7}{8}$  each have one piece missing from the whole. How can you use the sizes of the missing pieces to compare the two fractions? See possible answer at the left.

Name \_\_\_\_\_

2 It takes Jack  $\frac{3}{4}$  hour to fix a tire. It takes Renee  $\frac{2}{3}$  hour to fix a tire. Who takes a longer time to fix a tire? Possible visual models are shown.

B. How do the lengths of the visual models for  $\frac{3}{4}$  hour and  $\frac{2}{3}$  hour compare? Who takes a longer time?  
The visual model for Jack's time is longer than the one for Renee's. Jack takes a longer time.

C. Use the symbols  $<$  or  $>$  to write a statement comparing the two fractions.  $\frac{3}{4} > \frac{2}{3}$

### Check Understanding

Possible visual models are shown.

1 Emma fills  $\frac{2}{3}$  of a jug with water. She fills  $\frac{1}{2}$  of a same-sized jug with sports drink. Does Emma pour more water or more sports drink?

water

sports drink

Complete the visual models to solve. Justify your answer.  
Emma pours more sports drink. Possible answer: The visual model for  $\frac{1}{2}$  is longer than the one for  $\frac{2}{3}$ . So,  $\frac{1}{2}$  is greater than  $\frac{2}{3}$ .

Complete the visual model to show each fraction. Then write  $<$  or  $>$  to compare. Possible visual models are shown.

### Task 2

**Use Tools** Tell students that using area models is one way to solve this problem. Ask students to determine other visual models they could use. You could suggest a circle model because it resembles a clock face. This may help students connect the modeled value to the actual quantity of time elapsed.

#### Sample Guided Discussion:

- Q How do the lines dividing each rectangle help you show each fraction? Possible answer: Jack's rectangle is divided into 4 equal parts, so I can shade 3 parts to show  $\frac{3}{4}$ . Renee's rectangle is divided into 3 equal parts, so I can shade 2 parts to show  $\frac{2}{3}$ .
- Q How do you remember which number is greater when comparing numbers using the symbols  $<$  or  $>$ ? Possible answer: I remember that the point end of the " $>$ " shape points to the lesser number.

### OPTIMIZE OUTPUT Stronger and Clearer

Have students share how they solved this problem. Remind students to ask questions of each other that focus on how they approached the problem. Then have students refine their answers.

# Grade Level Book Layout

## 3rd Grade:

“Spark Your Learning”

“Build Understanding”

“Check Understanding”

“On Your Own”

---

## 4th Grade:

“Step It Out”

“Check Understanding”

“On Your Own”

\*Review at the end of each module

## 5th Grade:

“Step It Out”

“Check Understanding”

“On Your Own”

\*Review at the end of each module

## 6th Grade:

“Are You Ready”

“Check Understanding”

“On Your Own”

“Test Prep”

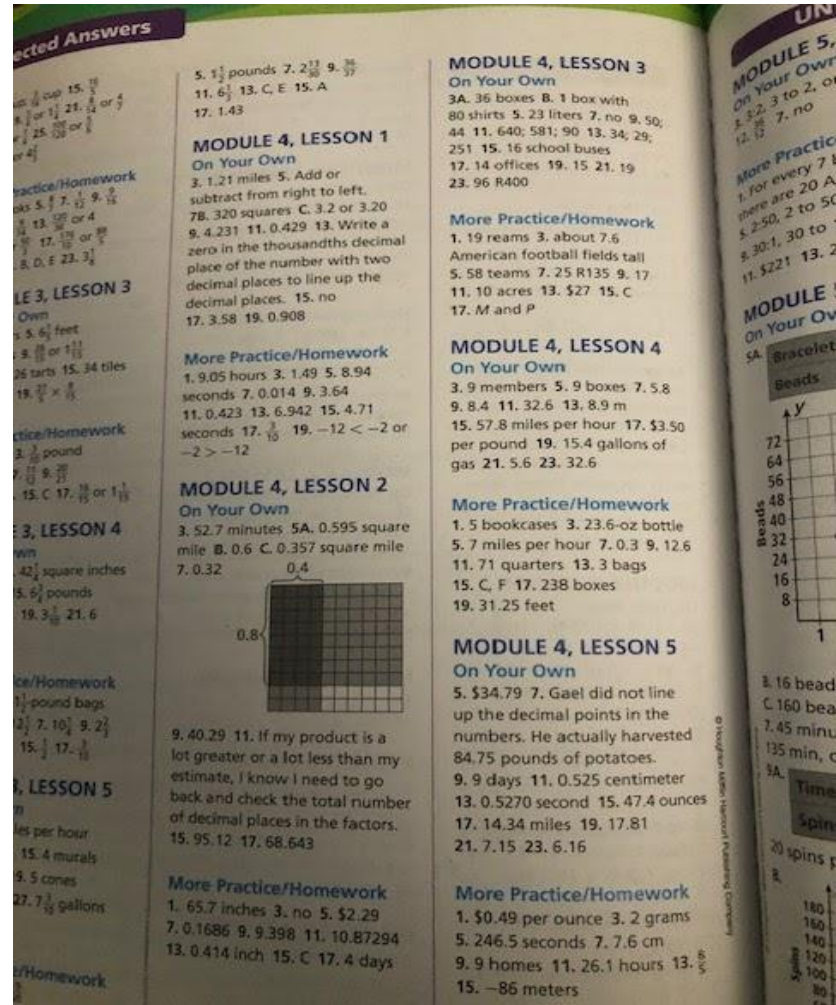

“Spiral Review”

# Upon Further Investigation

## More Features:

1. What is a module? .... A Chapter
2. Most modules are 4-7 lessons in length
3. Glossary of terms and definitions (some are built directly into the lesson)
4. Index - content and page #
5. **Selected answers - yes they exist!**
  - a. **Are you on target?**
6. Increased opportunity for practice!
  - a. Not all problems are assigned.

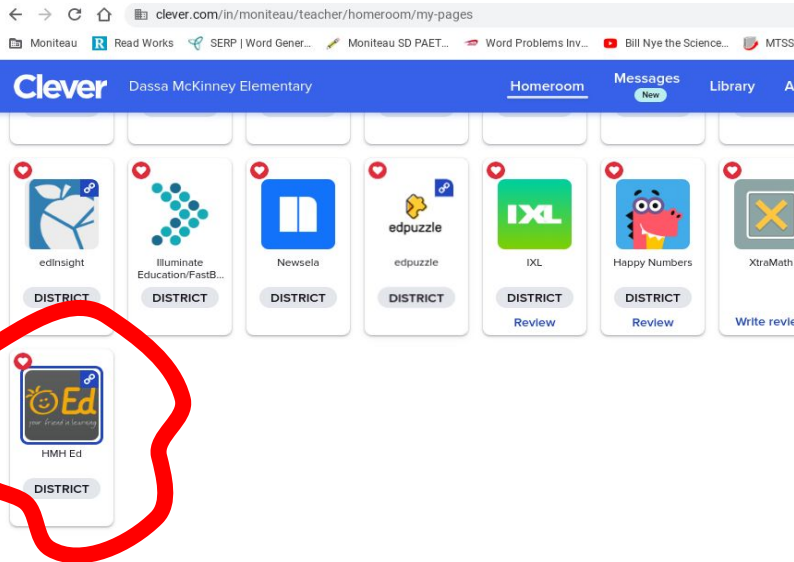

# Online Textbook - YES, you all have access!

Student/Parent Access:

- Each student has access to grade level specific textbook (print pages, access questions, etc...)

- All students have access to the online version of the text; accessed through **CLEVER**

A screenshot of a textbook page for 'Divide Multi-Digit Whole Numbers'. The page is titled 'LESSON 3' and 'Apply and Practice'. The main heading is 'Divide Multi-Digit Whole Numbers' with a sub-heading 'Learn Together Step It Out'. The text reads: 'divide multi-digit whole numbers by multi-digit numbers with or without remainders.' Below this is a 'Step It Out' section with several tasks. Task 1 asks to write an expression for  $432 \div 18$  and estimate the quotient. Task 2 asks to complete a division problem. Task 3 asks to estimate the quotient for  $800 \div 125$ . The page includes a 'Sample Guided Discussion' and a 'Turn and Talk' section. A photograph of a man looking at a phone is on the right side of the page. The page number '115' is at the bottom right.

# Math Summary In General

## Practice at Home:

- Don't worry about the grade, worry more about the process and are they understanding how they got to that answer!
- IXL - interactive program that is aligned and organized by standard. Students can practice as much as necessary!
- Xtramath - "foundational 4" and requires 5-10min to complete a session
- **Remember, Math is a SKILL that requires constant practice and attention!**

## Communication is Key:

1. Take ownership of the educational/math process!
  - a. Child/Parent communication
2. Please reach out to the math teachers with concerns you see at home (concepts, homework, etc...)
3. More than one way to achieve the outcome!
  - a. "I wasn't taught like that!"
